

Unit Testing | Lesson 1

Practice: Creating a Unit Test

Instructions

Think back to a method you've written in a previous project—this could be a method that calculates something, processes user input, or manipulates data.

Step 1: Write a unit test for that method using JUnit.

Choose one method you've written in the past and write a corresponding JUnit test. Make sure to:

- Use the `@Test` annotation
- Give your test method a descriptive name
- Include assertions to check for expected behavior
- Add at least one "happy path" test and one "edge case" if possible

Step 2: Evaluate your unit test using the checklist provided below.

Use this checklist to assess the quality of your test. Copy this checklist into your code as a comment and ensure that you go through it to make sure the unit test is of high quality.

- ☐ The test class mirrors the name of the class being tested (with Test at the end)
- ☐ The test method name clearly describes what is being tested
- ☐ The test can run independently and doesn't rely on other tests
- ☐ There is at least one test for the normal ("happy path") case
- ☐ There is at least one test for an edge case or unusual input
- ☐ The test uses appropriate assertions to verify behavior

Setup

For this activity, you will create your own repository to store your code:

1. Create a new repository.
2. Name it: practice-creating-a-unit-test[Your First Name]-[Your Last Initial]
3. Make sure the repository is public.
4. Clone the repository to your local machine.
5. Start working on the code.
6. When you are finished, commit your changes and push them to your repository.

Submission

Submit the url for your GitHub repo in the field below.
